

Krim

Every AI action validated before it runs.

An autonomous workforce across the full credit lifecycle.

A record that learns and stays inside your walls.

The operating system for regulated banking.

01

Volume scaled.
The operation didn't.

The same workflows that processed a thousand loans now process ten thousand--with more headcount carrying the difference. The operation grew bigger. It did not grow smarter.

01

02

In credit, a confident error
is a regulatory event.

A misquoted rate. An incorrect balance. A fabricated disclosure. General-purpose AI produces plausible output. Regulators require defensible output. That gap is the liability.

02

03

The decision exists.
The reasoning doesn't.

Adverse action requires specific explanation, traceable step by step. AI that cannot show its work is compliance-ineligible.

03

04

The institution accumulates data.
It accumulates nothing else.

Origination, servicing, collections, and compliance each run on separate systems. A decision made in one function is invisible to the next. The institution grows. Its intelligence does not.

04

VALIDATE

Every output checked before it acts.

33-point pipeline Regulatory Policy Operational

ACT

Five autonomous co-workers. Origination to compliance.

COMPOUND

Every decision recorded. Intelligence stays inside your walls.

Immutable audit trail Sovereign by construction Compounds with every cycle

01 **VALIDATION**

The check runs before the action.

Every Karta workflow runs through the 33-point validation engine before any output reaches a borrower, a regulator, or a system of record. The risk is contained before it exists.

02 **COVERAGE**

One runtime, one audit trail, one governance model.

Origination to collections -- the same system, the same record. No handoff between tools. No gap between what happened and what was logged.

03 **SOVEREIGNTY**

Customer data never leaves.

Model weights, transaction data, and telemetry stay inside the institution's infrastructure. A structural guarantee, not a contractual one.

04 **INTELLIGENCE**

The record compounds inside your walls.

Every decision feeds back under the institution's own governance. That learning cannot be extracted, replicated, or acquired by a competitor.

01

Decisions your regulators can follow.

Every output is documented, explainable, and audit-ready before it leaves the system. Adverse decisions can be explained, step by step.

33-point pre-execution validation

02

More volume. The same headcount.

Routine tasks across origination, servicing, and collections run without human initiation. Capacity scales with the portfolio, not with hiring.

Five Karta co-workers, end-to-end

03

An edge that cannot be bought.

The intelligence built on your portfolio and outcomes lives inside your infrastructure. A competitor cannot acquire it. It compounds with every loan.

Sovereign, self-hosted memory

Ready to see it working in your environment?

Every demo runs against a live scenario -- bring the use case you want answered.
